Rules for Xerte usage.

The history array is used to identify the page

The Next button

The Next button is always enabled but the action taken depends on a comparison of the pointer value with the historyArray.length

```
If (pointer < historyArray.length){  
    // next action goes forward in history  
    Pointer = pointer +1; // allow for next button use  
    Go to historyArray[pointer - 1]  
} else {  
    // next action is to next page in page index array sequence i.e. a “normal” xerte next.  
}
```

The Back button

The Back button is only enabled when the pointer value is greater than 0

```
If (pointer == arrayLen){  
    //add current page to History array  
    historyArray.push(page);  
    Pointer = arrayLen;  
}  
Pointer = pointer -1; // allow for back button use  
Go to historyArray[pointer - 1]
```

Action when following a link

```
If (pointer < arrayLen){  
    // delete pages after current page  
    historyArray.length = pointer;  
} else {  
    //Add current page to history array  
    historyArray.push(page);  
}  
Pointer = arrayLen;  
Go to destination page specified by link;
```
